

## **Possible Problems with Lab 3. Configuring VMware vCenter Server Appliance**

*Note that you if you are attempting this Lab immediately after the first lab, you can some of the instructions and begin at: Part 1. Configure the vCenter Server Appliance for first use → Step 7. At the top of the page click the Go Home icon.*

### *Part 1. Configure the vCenter Server Appliance for first use*

*17. In the Deploy OVF Template wizard section 2d Customize template, enter the corresponding values form the following table in the form. (Note: Click on the triangle next to Networking Properties to expand the settings window.)*

Pay particular attention to the settings, making sure you get them right. In particular, there are five values you need to set: hostname, default gateway, DNS, IP address, and netmask.

Hostname	vcenter-2
Default Gateway	172.16.1.99
DNS	172.16.1.99
Network 1 IP Address	172.16.1.2
Network 1 Netmask	255.255.255.0

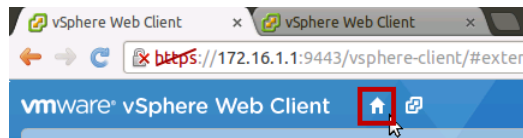

### *Part 3. Manage vSphere License Keys*

*5. In the Enter new vSphere license keys one per line field, enter the vCenter Server license key and vSphere license key (See the hot box below). Include the hyphens: XXXXX-XXXXX-XXXXX-XXXXX-XXXXX. (The dialog box requires a hyphen every five characters.)*

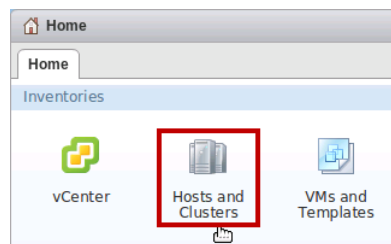

The license keys are provided on the DVD, so skip this step and proceed with Step 6 instead.

### Part 3. Setup a New User Account on vCenter

Before starting this part of the lab task, you need to first **switch back to the original browser tab in Chrome**, then click on the **Go Home** button:

Now click on the **Hosts and Clusters** link.

You will now find the VMware vCenter Server Appliance link on the left hand side of the web page:
